

## Native VLAN mismatch

You're a network engineer who is configuring a Cisco Switch, you start receiving a message saying **Native VLAN mismatch**. What is the most likely reason for receiving this message?

*Selecione uma alternativa*

- A** The most likely reason is to have the local and remote Switches both configured with native VLAN 1, we need to change to a different number
- B** The most likely reason is to have the local and remote Switches configured with a different native vlan in each side
- C** The most likely reason is that the user forgot to enable the native VLAN on one Switch whereas he enabled the native VLAN on the other Switch
- D** The most likely reason is to have the local and remote Switches both configured with a native VLAN different than the default 1, we must configure them to use VLAN 1
