Questão #33

PROGRESSO:

33/60

You have instances hosted on a private subnet on a VPC. The instance must download updates from the internet. What would be the most efficient and safe solution?

Selecione uma alternativa

- A** Create a VPC link to the internet to allow the instances in the private subnet to download the updates
- B** Use a NAT gateway to allow the instances in the private subnet to download the updates
- C** Create a new public subnet and move the instance to that subnet
- D** Create a new EC2 Instance to download the updates separately and then push them to the required instance.
