

Questão #58

PROGRESSO:

58/60

After creating a new AWS account, you use the API to request 40 on-demand EC2 instances in a single AZ. After 20 successful requests, subsequent requests failed. What could be a reason for this issue, and how can you resolve it?

Selecione uma alternativa

- A** AWS allows you to provision no more than 20 instances per AZ. Select a different AZ and retry the failed request.
- B** You encountered an API throttling situation and should try the failed requests using an exponential decay retry algorithm.
- C** You encountered a soft limit of 20 instances per region. Submit the limit increase form and retry the failed requests once approved.
- D** You need to use VPC in order to provision more than 20 instances in a single AZ. Simply terminate the resources already provisioned and re-launch them all in a new VPC.
