

(Opcional) XPath sem Camel

Repare o código abaixo:

```
public class Teste {  
  
    public static void main(String[] args) throws Exception {  
  
        DocumentBuilderFactory factory = DocumentBuilderFactory.newInstance();  
        DocumentBuilder builder = factory.newDocumentBuilder();  
  
        File pom = new File("pom.xml");  
        Document doc = builder.parse(new FileInputStream(pom));  
  
        XPathFactory xPathfactory = XPathFactory.newInstance();  
        XPath xpath = xPathfactory.newXPath();  
        String xpathString = "/project/properties/camel-version";  
        XPathExpression expr = xpath.compile(xpathString);  
  
        String versao = expr.evaluate(doc);  
    }  
}
```

Para ter a mesma funcionalidade no Camel usamos o método:

Selecione uma alternativa

A `xpath("/project/properties/camel-version")`

B `test("/project/properties/camel-version")`

C `split("/project/properties/camel-version")`

D `filter("/project/properties/camel-version")`
