

Native VLAN

Let's say you have a junior network engineer who asks you if he needs to change the native Vlan to a different number than the VLAN 1. What is your answer?

Selecione uma alternativa

- A** You tell your junior network engineer that he doesn't have to, it's better to leave it as the default 1 in order to keep all Switches configured exactly the same way
- B** You tell your junior network engineer that there's no need for this change since the native vlan doesn't pass any important data
- C** You tell your junior network engineer that it's very important. The native VLAN passes untagged frames, which can be management protocol between Switches and this can be a security risk
- D** You tell your junior network engineer that it's better to create a new VLAN for it just because you can enhance performance.
