

## Transcrição

O redirecionamento de links é um problema muito comum em sistemas web tanto é que esse é um problema descrito também no Ranking da **OWASP** disponível aqui.

No ranking esse tipo de vulnerabilidade ocupa a décima posição. Conforme vimos, através de redirecionamentos é possível inserir a URL mais vantajosa para nós e dessa maneira podemos enganar diversas vítimas.

Clicando no item do *A10 - Unvalidated Redirects and Forwards* somos redirecionados para a seguinte página:

The screenshot shows the OWASP Top 10 2013 page. The browser address bar displays [https://www.owasp.org/index.php/Top\\_10\\_2013-Top\\_10](https://www.owasp.org/index.php/Top_10_2013-Top_10). The page features a sidebar with navigation links: Presentations, Press, Projects, Video, Volunteer, Reference, Activities, Attacks, Code Snippets, Controls, Glossary, How To..., Java Project, .NET Project, Principles, Technologies, Threat Agents, Vulnerabilities, Language, and Tools. The main content area lists the top 10 vulnerabilities. The A10 item, 'Unvalidated Redirects and Forwards', is highlighted in green. The description for A10 states: 'Web applications frequently redirect and forward users to other pages and websites, and use untrusted data to determine the destination pages. Without proper validation, attackers can redirect victims to phishing or malware sites, or use forwards to access unauthorized pages.'

Vulnerability	Description
A4-Insecure Direct Object References	A direct object reference occurs when a developer exposes a reference to an internal implementation object, such as a file, directory, or database key. Without an access control check or other protection, attackers can manipulate these references to access unauthorized data.
A5-Security Misconfiguration	Good security requires having a secure configuration defined and deployed for the application, frameworks, application server, web server, database server, and platform. Secure settings should be defined, implemented, and maintained, as defaults are often insecure. Additionally, software should be kept up to date.
A6-Sensitive Data Exposure	Many web applications do not properly protect sensitive data, such as credit cards, tax IDs, and authentication credentials. Attackers may steal or modify such weakly protected data to conduct credit card fraud, identity theft, or other crimes. Sensitive data deserves extra protection such as encryption at rest or in transit, as well as special precautions when exchanged with the browser.
A7-Missing Function Level Access Control	Most web applications verify function level access rights before making that functionality visible in the UI. However, applications need to perform the same access control checks on the server when each function is accessed. If requests are not verified, attackers will be able to forge requests in order to access functionality without proper authorization.
A8-Cross-Site Request Forgery (CSRF)	A CSRF attack forces a logged-on victim's browser to send a forged HTTP request, including the victim's session cookie and any other automatically included authentication information, to a vulnerable web application. This allows the attacker to force the victim's browser to generate requests the vulnerable application thinks are legitimate requests from the victim.
A9-Using Components with Known Vulnerabilities	Components, such as libraries, frameworks, and other software modules, almost always run with full privileges. If a vulnerable component is exploited, such an attack can facilitate serious data loss or server takeover. Applications using components with known vulnerabilities may undermine application defenses and enable a range of possible attacks and impacts.
A10-Unvalidated Redirects and Forwards	Web applications frequently redirect and forward users to other pages and websites, and use untrusted data to determine the destination pages. Without proper validation, attackers can redirect victims to phishing or malware sites, or use forwards to access unauthorized pages.

Nesta página verificamos informações a cerca desta vulnerabilidade e também meios de prevenção. Uma das maneiras de evitar ataques desse tipo é não utilizar `redirects` e sempre verificar se os redirecionamentos estão de acordo com o que foi proposto pelos desenvolvedores do sistema.
