

Updating existing product

In this lesson you will see how to use update product endpoint to update a product in the server. Since you have seen how to save new product in the previous video, doing this thing is much easier.

Just modify the update method in `app.js` file like so.

```
update () {  
  this.product.price = this.product.price * 100;  
  
  axios.put('/products/' + this.product.id, this.product)  
    .then(({ data }) => {  
      let index = this.products.findIndex(item => item.id === this.product.id);  
  
      this.products.splice(index, 1, data.data);  
  
      this.isEdit = false;  
  
      this.errors = {};  
  
      $(this.$refs.vuemodal).modal('hide');  
    })  
    .catch(({ response }) => {  
      this.errors = response.data.errors  
    })  
}
```

Save the change, and try to update a product. Now the change that you make will persist in the database server.
