

## Security violation

Let's say you configure a Cisco Switch to operate in secure mode, when there is a security violation and the port shutdown. How can you recover this port to make it operate normally again?

*Selecione uma alternativa*

- A** Since this port was shutdown due a security violation, we need to type a special command **interface up**
- B** We need first to administratively shutdown the port with the command **shutdown** and then we need to enable the interface wth the command **no shutdown**
- C** We need to administratavely shutdown the port with the command **shutdown** after that the port shall operate normally
- D** We need to enable the interface with the command **no shutdown** and the port shall operate normally afterwards
