Broadcast address

Consider you have a junior network engineer. He's analyzing the protocols passing through the network and he asks you why the MAC address **FF-FF-FF-FF-FF-FF** is not listed on the Switch, what's your answer?

Selecione uma alternativa

A This MAC address is used for broadcast communication and therefore wil never be an address of a device

B The reason for that is that the Switches will never learn a MAC address on its own, we need to manually configure it on the Switch

C There's most likely a problem on the Switch interface that prevented it from learning this MAC address

D This MAC address is used for multicast communication and that's the reason why the Switch doesn't list it
